Our commitment to the aluminium industry

We have the right lubricants for all areas of the aluminium production and processing industry. Lubricants which you can trust to do exactly the job you expect of them. We are committed to understanding the industry's needs worldwide and to providing the highest quality products and services. Not only do we meet these needs, we seek continued improvement; an approach dedicated to making the highest quality aluminium products in the most cost-effective manner. It is a commitment we are proud to have endorsed by many of our customers.

Quality, reliability and efficiency

These attributes distinguish us from the competition. We offer products to meet your every need, technical support to help you keep your production on schedule, and a global reach, all managed by a business professional who is focused on your bottom line. That is why we are a leading supplier to the aluminium rolling industry, lubricating a considerable proportion of aluminium mills in the world.

Esso products to meet your need worldwide

Most of today's modern rolling mills operate at high speeds, under heavy loads or at extreme temperatures, and frequently under tight production schedules.

Whether your need is in the areas of smelting and casting, hot and cold rolling, extrusion and forging, drawing, forming or machining, Esso technologies match your production requirements. We also have the right lubricants for the job.

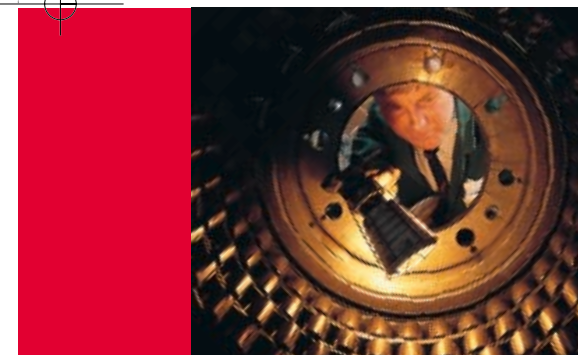

Esso lubricants are precisely designed to excel in this environment. Carefully formulated and approved by major equipment builders, Esso products, available in all regions around the world, are used to perform in even the most demanding applications.

We can help you make your work environment safer

We are committed to developing products which are safe to use in the workplace. For the aluminium rolling industry, we have successfully minimised emissions by tailoring our lubricating products to the needs of each application and by limiting the volume of oil to be disposed of.

We can provide you with the integrated specialist support you need

We know that the aluminium industry is facing considerable changes. Higher standards are being called for, new ideas and developments are being sought after. We will analyse your specific requirements and, in consultation with you, offer the optimum lubricants package. Our field engineers will be aware of your particular needs, and have available all the technical back-up and research laboratory facilities. As a result, you will be able to achieve levels of quality, production efficiency and reliability you may not have thought possible.

Condition monitoring through a specific oil analysis programme

With today's exacting production requirements, the condition of your machinery is too important to leave to guesswork. That's why we have developed a specific oil analysis programme. Regular analysis of the lubricant in service will enable us to accurately diagnose the present state of your equipment and give you advanced warning if any special attention is needed.

A trend analysis will help your maintenance department to keep your machinery in first-class condition.

Your local representative will assist you to:

- Develop a list of critical equipment to be monitored;
- Determine sampling intervals;
- Supply appropriate sampling kits, equipment and instructions;
- Establish training for effective interpretation of oil analysis;
- Ensure pro-active communication and feed-back.

Esso Lubricants for the Aluminium Rolling Industry

Product Line	Application
Prosol Series	Aluminium Hot Rolling
Somentor Series	Aluminium Cold Rolling
Norpar Series	Aluminium Cold Rolling
Wyrol Series	Additive Concentrates
Wyrol H, HS	Low-staining Hydraulic Oils
Wyrol B, BG	Low-staining Bearing and Gear Box Lubricants
Wyrol MS	Mist Spray Systems for Bearing Lubrication
Wyrol DF Series	Foil Doubling Oil
Airclean Oil	Scrubber Oil

Note : Availability of products is subject to local conditions. See product data sheets for more details.
